QUICK START GUIDE

For those users who want to quickly try the role this guide provides an example of how to create users, install packages and configure services.

• Install the role vbotka.linux_postinstall

```
shell> ansible-galaxy install vbotka.linux_postinstall
```

• Create the playbook linux-postinstall.yml for single host srv.example.com (2)

```
shell> cat linux-postinstall.yml

hosts: srv.example.com

gather_facts: true

connection: ssh

remote_user: admin

become: yes

become_user: root

become_method: sudo

roles:

- vbotka.linux_postinstall
```

• Create host_vars with customized variables.

```
shell> ls -1 host_vars/srv.example.com/lp-*
host_vars/srv.example.com/lp-common.yml
host_vars/srv.example.com/lp-users.yml
host_vars/srv.example.com/lp-passwords.yml
host_vars/srv.example.com/lp-packages.yml
host_vars/srv.example.com/lp-service.yml
```

• To speedup the execution let's set some variables (2-4) to false.

```
shell> cat host_vars/srv.example.com/lp-common.yml
lp_debug: false
lp_backup_conf: false
lp_flavors_enable: false
```

· Create users.

```
shell> cat host_vars/srv.example.com/lp-users.yml
lp_users:
    - {name: ansible,
         shell: /bin/sh}
    - {name: admin,
         shell: /bin/bash}
```

• Configure passwords.

```
shell> cat host_vars/srv.example.com/lp-passwords.yml
lp_passwords: true
lp_passwordstore: true
lp_passwordstore_create: false
lp_passwordstore_overwrite: false
```

• Install packages and enable autoremove.

```
shell> cat host_vars/srv.example.com/lp-packages.yml
lp_packages_autoremove: true
lp_packages_install:
    - ansible
    - ansible-lint
    - ansible-tower-cli
```

• Configure services.

```
shell> cat host_vars/srv.example.com/lp-service.yml
lp_service_debug: true
lp_service:
    - {name: ssh, state: started, enabled: true}
```

• Text syntax and review variables

```
shell> ansible-playbook linux-postinstall.yml -e 'lp_debug=true' -CD
```

· Install packages

```
shell> ansible-playbook linux-postinstall.yml -t lp_packages
```

• Display variables

```
shell> ansible-playbook linux-postinstall.yml -t lp_debug -e 'lp_debug=true'
```

• Run the playbook

```
shell> ansible-playbook linux-postinstall.yml
```

 - Best practice

2.1 Introduction

• Ansible role: linux_postinstall

• Supported systems: Ubuntu

• Requirements: ansible_lib

<TBD>

2.2 Installation

The most convenient way how to install an Ansible role is to use Ansible Galaxy CLI ansible-galaxy. The utility comes with the standard Ansible package and provides the user with a simple interface to the Ansible Galaxy's services. For example, take a look at the current status of the role

```
shell> ansible-galaxy info vbotka.linux_postinstall
```

and install it

```
shell> ansible-galaxy install vbotka.linux_postinstall
```

Install the library of tasks

```
shell> ansible-galaxy install vbotka.ansible_lib
```

See also:

- To install specific versions from various sources see Installing content.
- Take a look at other roles shell> ansible-galaxy search --author=vbotka

2.3 Playbook

Below is a simple playbook that calls this role at a single host srv.example.com (2)

```
shell> cat linux-postinstall.yml
- hosts: srv.example.com
gather_facts: true
connection: ssh
remote_user: admin
become: yes
become_user: root
become_method: sudo
roles:
- vbotka.linux_postinstall
```

Note: gather_facts: true (3) must be set to gather facts needed to evaluate OS-specific options of the role. For example to install packages the variable ansible_os_family is needed to select the appropriate Ansible module.

See also:

- For details see Connection Plugins (4-5)
- See also Understanding Privilege Escalation (6-8)

2.4 Debug

To see additional debug information enable debug output in the configuration

```
lp_debug: true
```

, or set the extra variable in the command

```
shell> ansible-playbook linux_postinstall.yml -e 'lp_debug=true'
```

Note: The debug output of this role is optimized for the **yaml** callback plugin. Set this plugin for example in the environment shell> export ANSIBLE_STDOUT_CALLBACK=yaml.

See also:

· Playbook Debugger

2.5 Tags

The tags provide the user with a very useful tool to run selected tasks of the role. To see what tags are available list the tags of the role with the command

```
shell> ansible-playbook linux-postinstall.yml --list-tags
playbook: linux-postinstall.yml
play #1 (srv.example.com): srv.example.com TAGS: []
TASK TAGS: [always, lp_acpi, lp_acpi_actions, lp_acpi_events, lp_aliases,

lp_zfs_manage, lp_zfs_mountpoints, lp_zfs_packages]
```

For example, display the list of the variables and their values with the tag lp_debug (when the debug is enabled lp_debug: true)

```
shell> ansible-playbook linux_postinstall.yml -t lp_debug
```

See what packages will be installed

2.5. Tags 5

```
shell> ansible-playbook linux_postinstall -t lp_packages --check
```

Install packages and exit the play

```
shell> ansible-playbook linux_postinstall.yml -t lp_packages
```

2.6 Tasks

2.6.1 Passwords

Synopsis

Manage user's passwords. At the moment only passwordstore framework is available.

Passwordstore

Create, or update passwords of selected users at remote hosts by the *passwordstore.org pass* utility. See details of the included task al_pws_user_host.yml

Note: Utility pass is required at controller.

Example 1: Update userpass, or create it if does not exists

Let's start with no passwords stored in passwordstore for users at host test_01. The command show no results

```
shell> pass test_01
```

Create a playbook

```
shell> cat linux-postinstall.yml
- hosts: test_01
  become: true
  roles:
    - vbotka.linux_postinstall
```

Create host_vars/test_01/lp-users.yml with two users user1 and user2

```
shell> cat host_vars/test_01/lp-users.yml
lp_users:
    - {name: user1, shell: /bin/sh}
    - {name: user2, shell: /bin/bash}
```

Create users. This step will create these two users and configure their login shell. Other paramteres of the Annsible module user will be ommitted because the only required parameter is *name*. It's a good idea to create one account with the login shell */bin/sh* and use it as Ansible remote_user.

```
shell> ansible-playbook linux-postinstall.yml -t lp_users
...

TASK [vbotka.linux_postinstall : users: Manage user accounts] *******
changed: [test_01] => (item=user1)
changed: [test_01] => (item=user2)
```

Create host_vars/test_01/lp-passwords.yml

```
shell> cat host_vars/test_01/lp-passwords.yml
lp_passwords: true
lp_passwordstore: true
lp_passwordstore_create: false
lp_passwordstore_overwrite: false
```

Create passwords. This step will use *passwordstore* to create the passwords and configure them. New passwords will be created only if allowed by the configuration of *lp_passwordstore_create*. We set this variable to *True* in this command but keep it *False* in the configuration to keep the passwords once created. The value of *lp_passwordstore_overwrite* is *False*. New passwords will be assigned to the users if no passwords have been assigned to the users before. To change the passwords in the future set both variables *True* on the commandline.

The command is idempotent

Show the passwords stored in *passwordstore* at the controller

```
shell> pass test_01
test_01
user1
user2

shell> pass test_01/user1
1rLy0eVpJiTpzj-4
lookup_pass: First generated by ansible on 01/07/2020 16:59:00

shell> pass test_01/user2
u4FLTCkKOHAyJxkg
lookup_pass: First generated by ansible on 01/07/2020 16:59:00
```

Show the *passwordstore* log at the controller

2.6. Tasks 7

```
shell> cd ~/.password-store
shell> git log

commit 61bb8bcd7c2a359f53c8b3d4bacb8854b4dd9f89 (HEAD -> master)
Author: Vladimir Botka <vbotka@gmail.com>
Date: Wed Jul 1 16:59:00 2020 +0200

Add given password for test_01/user2 to store.

commit 97b23a5221e721fb892d739b2817923a6db8614b
Author: Vladimir Botka <vbotka@gmail.com>
Date: Wed Jul 1 16:59:00 2020 +0200

Add given password for test_01/user1 to store.
```

Show the created users at the remote host

```
test_01> grep user /etc/passwd
user1:x:1003:1003::/home/user1:/bin/sh
user2:x:1004:1004::/home/user2:/bin/bash
```

Example 2: Update passwords submitted in the variable

Update passwords of users at host $test_01$. Use the same playbook and variables as in Example 1. Update the variable lp_users with the new passwords stored in the attribute userpass

```
shell> cat host_vars/test_01/lp-users.yml
lp_users:
    - {name: user1, shell: /bin/sh, userpass: user1_password}
    - {name: user2, shell: /bin/bash, userpass: user2_password}
```

Update the passwords

The command is idempotent

Show the passwords stored in passwordstore at the controller

```
shell> pass test_01
test_01
user1
user2
```

```
shell> pass test_01/user1
user1_password
lookup_pass: First generated by ansible on 01/07/2020 16:59:00
shell> pass test_01/user2
user2_password
lookup_pass: First generated by ansible on 01/07/2020 16:59:00
```

See the *passwordstore* log at the controller git log and test the new passwords at *test_01*.

Passwordstore

Create, or update passwords of selected users at remote hosts by the *passwordstore.org pass* utility. See details of the included task al_pws_user_host.yml

Note: Utility pass is required at controller.

Example 1: Update userpass, or create it if does not exists

Let's start with no passwords stored in passwordstore for users at host test_01. The command show no results

```
shell> pass test_01
```

Create a playbook

```
shell> cat linux-postinstall.yml
- hosts: test_01
  become: true
  roles:
    - vbotka.linux_postinstall
```

Create host vars/test 01/lp-users.yml with two users user1 and user2

```
shell> cat host_vars/test_01/lp-users.yml
lp_users:
   - {name: user1, shell: /bin/sh}
   - {name: user2, shell: /bin/bash}
```

Create users. This step will create these two users and configure their login shell. Other paramteres of the Annsible module user will be ommitted because the only required parameter is *name*. It's a good idea to create one account with the login shell */bin/sh* and use it as Ansible remote_user.

```
shell> ansible-playbook linux-postinstall.yml -t lp_users
...

TASK [vbotka.linux_postinstall : users: Manage user accounts] *******
changed: [test_01] => (item=user1)
changed: [test_01] => (item=user2)
```

Create host_vars/test_01/lp-passwords.yml

2.6. Tasks 9

```
shell> cat host_vars/test_01/lp-passwords.yml
lp_passwords: true
lp_passwordstore: true
lp_passwordstore_create: false
lp_passwordstore_overwrite: false
```

Create passwords. This step will use *passwordstore* to create the passwords and configure them. New passwords will be created only if allowed by the configuration of *lp_passwordstore_create*. We set this variable to *True* in this command but keep it *False* in the configuration to keep the passwords once created. The value of *lp_passwordstore_overwrite* is *False*. New passwords will be assigned to the users if no passwords have been assigned to the users before. To change the passwords in the future set both variables *True* on the commandline.

The command is idempotent

Show the passwords stored in passwordstore at the controller

```
shell> pass test_01
test_01
user1
user2

shell> pass test_01/user1
1rLy0eVpJiTpzj-4
lookup_pass: First generated by ansible on 01/07/2020 16:59:00

shell> pass test_01/user2
u4FLTCkKOHAyJxkg
lookup_pass: First generated by ansible on 01/07/2020 16:59:00
```

Show the *passwordstore* log at the controller

```
shell> cd ~/.password-store
shell> git log

commit 61bb8bcd7c2a359f53c8b3d4bacb8854b4dd9f89 (HEAD -> master)
Author: Vladimir Botka <vbotka@gmail.com>
Date: Wed Jul 1 16:59:00 2020 +0200

Add given password for test_01/user2 to store.
```

```
commit 97b23a5221e721fb892d739b2817923a6db8614b
Author: Vladimir Botka <vbotka@gmail.com>
Date: Wed Jul 1 16:59:00 2020 +0200

Add given password for test_01/user1 to store.
```

Show the created users at the remote host

```
test_01> grep user /etc/passwd
user1:x:1003:1003::/home/user1:/bin/sh
user2:x:1004:1004::/home/user2:/bin/bash
```

Example 2: Update passwords submitted in the variable

Update passwords of users at host $test_01$. Use the same playbook and variables as in Example 1. Update the variable lp_users with the new passwords stored in the attribute userpass

```
shell> cat host_vars/test_01/lp-users.yml
lp_users:
    - {name: user1, shell: /bin/sh, userpass: user1_password}
    - {name: user2, shell: /bin/bash, userpass: user2_password}
```

Update the passwords

The command is idempotent

Show the passwords stored in *passwordstore* at the controller

```
shell> pass test_01
test_01
user1
user2

shell> pass test_01/user1
user1_password
lookup_pass: First generated by ansible on 01/07/2020 16:59:00

shell> pass test_01/user2
user2_password
lookup_pass: First generated by ansible on 01/07/2020 16:59:00
```

See the *passwordstore* log at the controller git log and test the new passwords at *test_01*.

2.6. Tasks 11

2.7 Variables

In this chapter we describe role's default variables stored in the directory **defaults**.

```

Warning: Default value of **lp_passwords_debug_classified** and **lp_wpasupplicant_debug_classified** is **False**. Passwords will be displayed if these variables are enabled.

2.9 Best practice

Display the variables for debug if needed. Then disable this task lp_debug: false to speedup the playbook

```
shell> ansible-playbook linux-postinstall.yml -t lp_debug
```

Install packages automatically. Then disable this task <code>lp_packages_auto: false</code> to speedup the playbook

The role and the configuration data in the examples are idempotent. Once the installation and configuration have passed there should be no changes reported by *ansible-playbook* when running the playbook repeatedly. Disable debug, and install to speedup the playbook

```
shell> ansible-playbook linux-postinstall.yml
```

2.9. Best practice 19

3.1.49 ufw.yml

Synopsis: Configure ufw.

Description of the task.

[ufw.yml]

```
# linux-postinstall ufw
2
       Notes
   # * Aliases of parameters in ufw module not implemented in task
6
       "Configure ufw".
   # * It's not necessary to reload ufs after configuration has
       changed. Module ufw automatically updates the rules.
   # * Best practice: First time 'lp_ufw_reset: true'; configure and enable
10
       ufs (configuration item {state: 'enabled'} reloads firewall and
11
       enables firewall on boot); 'lp_ufw_enable: true' start and enable ufw
12
       service.
13
   # * Configuration on the fly: configure and enable ufs.
14
   # * The last configuration item should be {state: 'enabled'}.
   # * See: man ufw.
